Working Prototype Known Problems Report
OneApp
Team OneApp
12/1/17

The following are problems with the software the team has identified:

Problem 1: Refreshing, going forward/back, and navigating to pages other than the home page all give an error.
- *Location :* Possibly Routes folder/App.JS file
- *Action for Removal :* Fix the navigation routing or perhaps incorrect joins in our App.JS file

Problem 2: User access tokens are not saved to the account, requiring reauthorization each session.
- *Location :* MongoDB
- *Action for Removal :* Save each (Facebook/Twitter) of the access tokens in our database so user no longer has to re-log into their social media account each time.

Problem 3: Home page asks to register and login even after signing in successfully.
- *Location :* Home page Angular HTML/CSS
- *Action for Removal :* Update HTML/CSS so that home page displays something different after software detects user logged in.

Problem 4: Incorrect redirecting after user log in and twitter log in
- *Location :* Twitter/Log in page
- *Action for Removal :* Fix files to redirect to proper location

Problem 5: Twitter button doesn't disappear after logging in and timeline/home buttons are visible prior to logging in.
- *Location :* Twitter HTML/CSS angular files
- *Action for Removal :* Detect user log in and remove buttons if not logged in and display if they are.

Problem 6: Able to register with credentials that are already in the database (same email, username, etc).
- *Location :* MongoDB config files
- *Action for Removal :* Throw error when duplicate credentials are provided upon registration

Problem 7: Able to POST data to registration that bypasses email regex (@ checking, .com checking, etc)

- *Location :* Unknown
- *Action for Removal :* Get email checking figured out on the backend instead of just the frontend
